

1. Types of OS installation

Attended installation

- * Installation process usually needs a user who attends if to make choices such as accepting or declining an end user license agreement specifying performances such as the installation location, supply parameters or arriving in product activation.

Silent installation

- * An installation that does not display messages or windows during its program.
- * In bigger organizations where thousand of users work, displaying the applications become a typical task and for the reason silent, installation is performed so that the application is installed in background without affecting the work of user.

Unattended installation

- * An installation that is performed without user interaction during its programs or with no user present at all.
- * One of the reasons to use this approach is to automatic the installation of a large number of system

Expt. No. 01
Reg. No. 2081523017
Date / /

Page No. 01

Headless installation

- * Installation performed without using a computer monitor connected.
- * In attended form of headless installation another machine connects to the target machine and takes over the display output.

Scheduled or automated installation

- * An installation process that runs on a pre-set present time or when a predefined condition meet the requirements as opposed to an installation process that starts explicitly on a user's command.

clean installation

- * A clean installation is one that is done in the absence of any intervening elements such as old version of the computer program. Using installation or software from a previous installation.

Network installation

- * Network installation (Net install), is an installation of a program from a shared network resources that may be done by installing a minimum system before proceeding to download further packages as the network.

2. Boot Method

Boot is the process of starting a computer as initiated via hardware such as a button or by a software command.

Types of Booting

→ **warm Booting** :- The warm booting is that in which system starts from the starting or from initial state means.

* In the warm booting the system will be started from its beginning state means, first, the user will press the power button, then this will read all the instructions from the ROM and the operating system will be automatically get loaded into the system (RAM)

→ **Cold Booting** :- The cold booting is that in which system automatically starts when the system is in a running state.

3. File systems and Formatting

File system

→ A file system is a process of managing how and where data on a storage disk, which is also referred to as file management or FS

→ It is a logical disk components that compresses files separated into groups, which is known as directory

→ The file system enables user to view a file in the current directory as files are often managed in a hierarchy.

	Expt. No. <input type="text" value="01"/>	Reg. No. <input type="text" value="208IS23017"/>
	Date <input type="text" value="1 / 1"/>	Page No <input type="text" value="02"/>
Example of file system		
→ FAT :- FAT is a type of file system, which is developed for hard drives. It stands for file allocation table. FAT8, FAT12, FAT32, & FAT16. are all the different types of FAT		
→ GFS :- GFS is a file system which stands for global file system. It has the ability to make enable multiple computer's to act as integrated machine		
→ HFS :- HFS is the file system that is used on a Macintosh computer for creating a directory at the time a hard disk is formatted		
→ UDF :- UDF is the file system stands for universal disk format and used first developed by OSTA Optical storage technology association for ensuring consistency among data written to several optical media.		
→ NTFS :- NTFS is the file system, which stands for NT file system and stores and retrieves files on windows NT operating system and other version of windows like windows 2000, windows XP, windows 7, and windows 10.		

Formatting

Formatting is a process of preparing the storage device to store the data. Formatting storage device will erase the earlier contents of the device.

4. Post Installation tasks :-

Post Installation tasks are the set of steps to be carried out to ensure that the installation is complete and went smoothly.

- Post Installation Tasks for ubuntu operating system

-> online accounts

The first step allows user to configure online account in case user wants to integrate the desktop with different services.

-> Firepatch

Firepatch is a service that allows the installation of some updates that would generally require a system reboot of such as those of the kernel.

-> Help Improve ubuntu

In this step user can choose whether or not to send data from his system to ubuntu.

Privacy :

If requires, a user can enable location services so that apps on can determine user geographic location. all the applications installed by default on ubuntu are free software.

You are ready to start

The last screen shows some featured application - some of which are not free software with the option to open the software to center to install them.

Introduction to Unix

- * UNIX is an operating system
- * An operating system is a set of programs that act as a link between computer and the user
- * The operating system (OS) manages the resources of a computer
- * Examples of computer resources are :- CPU, RAM, disk memory, printers, display, keyboard etc.

users

↓
application software

↓
operating system software

↓
Hardware system

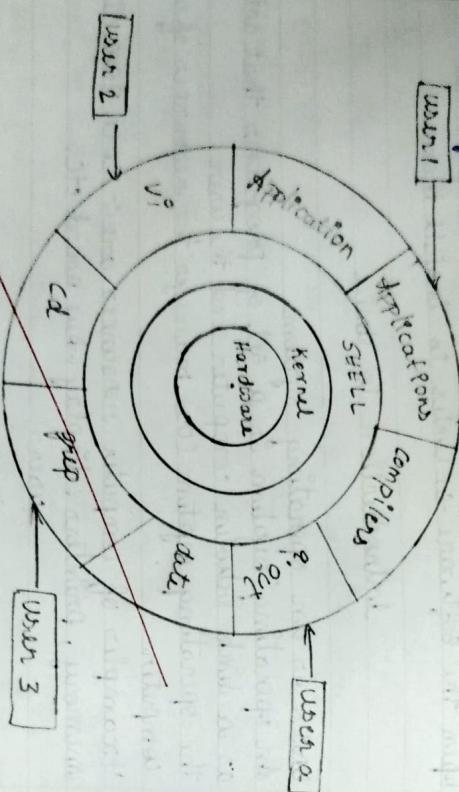

Fig :- operating system

- * UNIX OS allows complex tasks to be performed with a few key strokes

- * UNIX OS doesn't tell or warn the user about the consequences of the command.

- * There are numerous UNIX variants available in the market
Solaris UNIX, AIX, HP UNIX and OS/390 are few examples.
Linux is also a flavour of UNIX which is freely
available.

- * The UNIX operating system consists of a kernel layer, a shell layer, an application layer and files.

kernel

- * The kernel is the heart of the OS
- * It interacts with the machine's hardware
- * It is collection of routines written in C

Expt. No. [01]

Date [/ /]

Reg. No. [20815523017]

Page No [04]

SHELL

- * It is loaded into memory when the system is booted
- * It is loaded into memory when the system is booted
- * The shell interacts with the user
- * The shell is a command line interpreter.
- * There are multiple shells that are used by the user
- * Example:- Bourne shell, C shell, Korn shell, Bourne again shell.

File :

- * A file is an array of bytes that stores information
- * All the data of UNIX is organized into files
- * All files are then organized into directories

Features of UNIX

* Multi user

- * UNIX is a multiprogramming system
- * Multiple users can access the system by connecting to the points known as terminals
- * Several users can run multiple programs simultaneously on one system.

* Multitasking

- * UNIX is a multitasking system
- * A single user can also run multiple tasks.
- * Example:-

- * edit a file
- * print another file one on the printer
- * send email to a friend.
- * browse www.

In a multitasking environment a user sees one job running in the foreground, the next run in the background. users can switch jobs between background and foreground, suspend or even terminate them.

* Pattern Matching :-

- * UNIX has very sophisticated pattern matching features
- * Regular expressions are a features of UNIX
- * Regular Expressions describes a pattern to match, a sequence of characters, not words, within a line of text.

* Portable :-

- * UNIX can be installed on many hardware platforms
- * UNIX operating system is written in C language, hence it is more portable than the OS.

* UNIX Toolkit :-

~~UNIX offers facility to add and remove many applications as when required tools include~~

- * General purpose tools

Expt. No. 01
Date / /

Reg. No. 2081S23017
Page No. 05

- * Text manipulation tools
- * Compilers / interpreter
- * Networked application
- * System administration tools

* Programming facility :-

- * the unix shell is also a programming language; it was designed for programmer not for end user.
- * It has all the necessary ingredients, like control structure loop and variables that establish powerful programming language
- * These features are used to design shell script program that can also invoke unix commands
- * Many of the system's functions can be controlled and automated by using these all scripts

* Documentation

- * The principal on-line help facility available is the man command, which remains the most important references for commands and their configuration files.

- * Apart from the man documentation, there's a vast ocean of UNIX resources available on the internet.

Expt. No. [01]

Date [/ /]

Page No. [06]

- * Posix and single unix specification
 - The portable operating system interface is a family of standards specified by IEEE for maintaining compatibility between operating system.
 - Two of the most important standards from POSIX are
- POSIX.1 :- Specifies the C applications program interface
- POSIX.2 :- Deals with the shell and utilities
 - In 2001 joint initiative of x1 open and IEEE resulted in the unification of two standards
 - This is a single UNIX specifications version 3.

~~Sec A~~

Week - 02

Virtualization

Install and configure virtual machine - Virtual box

- terminal emulator is a computer program that reproduces a video terminal within some other display structure
- The terminal emulator allows an end-user to access the console all will as its applications such as text, user interface and command-line interface

Example for terminal Emulator :-

Terminator, RoxTerm, Eterm, Tilix, LX Terminal, Konsole, Kitty, st, Gnome-terminal, Terminology, Duper, Terminal, XTerm, Tilix term, Extraterm, mate-terminal, OEM Term, Termkit.

Example 1 :- xterm

- The xterm terminal application in a standard terminal emulator for the X window system

→ Installation :-

~~sudo apt :- git update~~

~~sudo apt :- git install xterm~~

Example 2 :- mate-terminal

- mate terminal is a terminal emulation application to a unix shell in the MATE environment

Expt. No. 02

Reg. No. 2081523012

Date / /

Page No. 07

- mate terminal also has the ability to use multiple terminal in a single window and supports management of different configuration (profile)
- mate terminal in a fork of Gnome-terminal
- Installation
 sudo apt-get update -y
 sudo apt-get install mate-terminal

Significance of Man command

- Man command in Linux is used to display the user manual of any command that run on the Terminal.
- It provides a detailed view of the command which includes NAME, SYNOPSIS, DESCRIPTION, OPTION, EXIT, STATUS, RETURN VALUES, ERRORS, FILES, VERSIONS, EXAMPLE, AUTHORS, and so on also.

- Every manual is divided into the following sections:-
 - * executable programs or shell commands
 - * System calls [Functions provided by the kernel]
 - * Library calls [Functions within program libraries]
 - * Games
 - * Special files
 - * file formats and conventions [filetypes / password]
 - * Miscellaneous
 - * System administration commands

Week - 03

File System

File and directory commands

ls (list)

- > Use ls without any arguments to display current directory contents.
- > ls with the -a option. files all begin with a "dot", which indicates they are "hidden" files.

→ ls -a

- > ls with -F. this command is useful for distinguishing between directories, ordinary files, and executable files

→ ls -F

- > ls with -l to obtain a "long" listing of files. an explanation of the information it provides appears below.

→ ls -l

```
-rwxr--r-x 1 jsmith staff 43 mar 23 18:14 prog1  
-rwxr--r-- 1 jsmith staff 10030 mar 22 20:41 sample.f  
drwxr--r-x 2 jsmith staff 512 mar 23 18:07 Subdir1  
drwxr--r-x 2 jsmith staff 512 mar 23 18:07 Subdir2  
drwxr--r-x 2 jsmith staff 512 mar 23 18:06 Subdir3  
1 2 3 4 5 6 7
```

1 = access modes / permission

2 = Number of links

3 = owner.

Expt. No. 03

Reg. No. 2081523017

Date 1/1

Page No 08

4 = group

5 = size (in bytes)

6 = date & time of last modification

7 = name of file

- > ls with R. Recursive listings which will display files and folders inside the folders recursively
 - ls -R
 - ls -R1

pwd (Present working directory)

- > will give the present working directory path information

mkdir (Make directory)

- > mkdir will create a new directory (folder)
- > Syntax :- mkdir directory name (folder name)
Ex :- mkdir dir poorvika

cd (Change directory)

- > cd is used to change directory

- > change home directory

→ cd

→ cd ~

- > change to a subdirectory within user home directory

→ cd poorvika / computer

→ pwd

→ Go up one level back to the current directory's parent directory
 > cd..
 > pwd

→ Change to the root (top-most) directory

 > cd /
 > pwd

rmdir: (Remove directory)

→ will remove (Delete) the directory

→ make sure that folder is empty before issuing rmdir command.

→ Make sure current directory is not part of the directory being deleted

 > rmdir poorvika

 > rmdir / poorvika / computer.

File manipulation commands :-

Creating File

> touch :- will create empty files

 Ex :- touch. a.txt b.txt

> Creating file and add contents at the end press

Enter key and $ctrl+z$

 Ex :- cat > a.txt

Welcome to operating system lab

Enjoy Typing commands

$ctrl+z$

Expt. No. 03
Date 1/1

Reg. No. 2081S23017
Page No 09

cat a.txt

Display the contents of files :

Syntax :- Cat filename
 Cat /path/ filename

Ex:- > cat a.txt
 > cat polytechnic /computer /a.txt.

rm (remove file)

> will remove (Delete) the file

Syntax : rm filename

rm path /filename

Ex :- rm a.txt

cp (copy)

> Used to create a copy of a existing file
 > Copy an existing file in current directory to another file in the current directory. Make sure that the file to be copied must be exists in specified location

Syntax : cp file1 file2

cp -i file1 file2

cp -R subdir1 subdir2

cp polytechnic /afile /a.txt;

> Change to another directory

 > cd ~1/polytechnic

 > pwd

> change to another one of subdirectories

 > cd ~1/polytechnic /computer

YDwL

mv (move)

- used to remove the file
- it can be used to rename file. Directory (folder) also.

Ex:- mv oldfilename newfilename
ls

Ex:- mv Oldfilename newfilename.
ls

more

- more is a filter for paging through text one screenful at a time

- use the more command to read the file
- more filename

less

- less is the opposite of more command

- use the more command to read a file
- less command.

cmp (compare)

- Compare two files byte by byte

→ Syntax: cmp -b file1 file2

\$ cmp file1 file2 <
file1 file2 differ: byte 7, line 2

head and tail

- output the first last part of files (by default first / last 10 lines)

> head filename

> tail filename

Expt. No. 03

Reg. No. 2081923017

Date 1/1

Page No. 10

Ex:- head -5 a.txt will display first 5 lines of a.txt

tail -5 .txt will display last 5 lines of a.txt

i) \$ head file3

shimla list

dog

goat

lion

tiger

-11-

2) \$ cat > file3

shimla list

dog

goat

lion

tiger

-11-

3) \$ head -4 file3

shimla list

dog

goat

lion

-11-

tail :- It is used to display the last few line of a file. By default if display the last 10 lines of a file

Syntax: tail <filename>

4) tail file3

goat

lion

tiger

cat

elephant

cheetah

rabbit

-11-

We can also specify the number of lines we want to display using '-n' option

Syntax : tail -n <filename>

\$ tail -5 file3

cheeta
rabbit
deer
sheep
zebra

File Permission

> There are three users in Linux namely owner (o), group (g), other (o)

> For all user can be identified with letter a

> Number assigned for permissions are read (r), write (w), execute (x)

> All three users will have three possible permission namely read (r), write (w), execute (x)

> Command used to change permission of file is chmod

Syntax :-

chmod filepermissionpattern filename
operation → assign (+), deny (-)

Relative permission

> To give execution permission for owner

> To give writing permission for group.

\$ ls -l

total • 12

Text processing commands

Sort :- It is used to sort a file arranging the records in a particular order
Syntax :- sort [Options] filename

options

1) -o :- used to save sorted content in specified file

Syntax :- Sort -o database database

2) -n :- used to sort the file contents in descending order

eg :- sort -n database

3) -h :- If the file contains numbers based on number values file contents can be sorted

eg :- sort -n database

4) -k :- Sort the files contents based on kth field values

eg :- sort -K 2 database

5) -u :- will remove duplicate entries in file while sorting

eg :- sort -u database

\$ sort -n database

Process Management

Process

- > A process is any active (running) instance of a program. In other words process is a program in execution.
- > A new process can be created by the fork() system call.

The new process consists of a copy of the address space of the original process (fork).

> Each process is given a unique process identification (PID)

- > PID is usually four-digit number
- This number is used to manage each process
- user can also use the process name to manage process

ps command

This command is used to display attributes of processes that are running currently.

ps -> Process Identification number

TTY -> Terminal

TIME -> CPU time taken by the process

CMD -> Process name

```
D:\LUGGUDU\TUT-VIRTUALBOX:~/practices$ ps
 PID TTY      TIME CMD
 2651 pts/0    00:00:00 bash

Nice and Renice :-

- > Nice : Nice is a value associated with a process that determines it's priority for CPU scheduling
- > The 'Nice' command is used to launch a process with a specified nice value.

Renice

- > Renice is a command used to change the nice value of an already running process it allows you to adjust the priority of a process while it's running.
- > renice -n 5 process name or job name
- > here is the above example increase priority of process with pid
you can also use command
renice -n -5p

Kill command

Kill command used to Terminate or send signal to process it allows you to manage running process effectively

Kill Pid

- > Sends the default signal to the process with specified pid (process id) for causing it to terminate

Expt. No. 04

Reg. No. 2021S23017

Date 1 /

Page No. 20

2) Kill -q pid :-

Kill -q pid is used to forcefully terminated a process with specified process id

Week - 05

Introduction to Process Synchronization

Commands to exhibit thread concepts

- * Threads are a popular programming abstraction for parallel executing on modern operating systems.
- * In Linux threads (also called lightweight processes (LWP)) created within a program will have the same "thread group ID" as the program's PID

Using the ps

The "-T" option for the ps command enables Thread views

ps -T -p {pid}

- * First find the all process containing word terminal

ps -ef | grep terminal

```
ubuntu@ubuntu-VirtualBox:~$ ps -ef | grep terminal
ubuntu 1891 1250 0 11:54 ? 00:00:02 /usr/libexec/gnome-terminal-server
ubuntu 2764 2909 0 11:54 pts/0 00:00:00 grep --color=auto terminal
ubuntu@ubuntu-VirtualBox:~$ ps -f p 1891
 PID SPID TTY      TIME CMD
1891 1891 ? 00:00:02 gnome-terminal-
1891 1892 ? 00:00:00 gnutty
1891 1893 ? 00:00:00 gdbus
1891 1895 ? 00:00:00 dconf worker
```

Expt. No. 03
Date / /

Reg. No. 2081523017
Page No 21

using the top

The top command can show a real-time view of individual threads

Example 1 : top

```
ubuntu@ubuntu-VirtualBox:~$ top
Tasks: 500 total, 5 running, 494 sleeping, 0 stopped, 0 zombie
Cpu(s): 0.7 utr, 5.0 syz, 0.0 stl, 0.0 idl, 0.0 nps, 0.0 Ns, 0.0 St
Mem: 388777K total, 70653K free, 318124K used, 3727K buff/cache
Swap: 388477K total, 0K used, 388477K free, 0K swap space

15 root 20 0 0 0 0 0 0 0:00.00 rcs_tasks_killed
16 root 20 0 0 0 0 0 0 0:00.52 rcs_prempt
17 root 20 0 0 0 0 0 0 0:00.00 MigrationB
18 root 20 0 0 0 0 0 0 0:00.00 dde_injector
19 root 20 0 0 0 0 0 0 0:00.00 cronjob
```

Example 2 : top -h -p 1422

```
ubuntu@ubuntu-VirtualBox:~$ top -h -p 1422
procs(np=3-1)
Usage:
  top -hv -b -cEelQOS1 -d secs -D max -uU user -p pid(s) -o field -w [cols]
ubuntu@ubuntu-VirtualBox:~$
```

See

Week -06

Memory Management.

1) Free Command

Syntax :- ~~free -m~~

- * The m option displays all data in MBs.

student@student-VirtualBox:~/aishwaryahks	tree -m
total	used free
Mem:	1106 909 197
/+ buffers/cache:	1501 454 1047
Swap:	2045 0 2045
student@student-VirtualBox:~/aishwaryahks	

2) /proc/meminfo

- * check memory usage by reading the file at /proc/meminfo

student@student-VirtualBox:~/aishwaryahks	/proc/meminfo
total	1106
used	909
free	197
shared	8
buffers	61
cached	393
student@student-VirtualBox:~/aishwaryahks	

4) RAM Information:-

- * To find out hardware information about the installed RAM use the dmidecode command

Syntax: ~~sudo dmidecode -t 17~~

student@student-VirtualBox:~/aishwaryahks	sudo dmidecode -t 17
[sudo] password for student:	
# dmidecode 2.12	
SMBIOS 2.5 present.	
student@student-VirtualBox:~/aishwaryahks

Week - 07

Shell Script

Write a shell program to perform arithmetic operations

```
read -p 'Enter a:' a
```

```
read -p 'Enter b:' b
```

```
add=$((a+b))
```

```
echo "Addition of $a and $b is $add"
```

```
sub=$((a-b))
```

```
echo "Subtraction of $a and $b is $sub"
```

```
mul=$((a*b))
```

```
echo "Multiplication of $a and $b is $mul"
```

```
div=$((a/b))
```

```
echo "Division of $a and $b is $div"
```

```
mod=$((a%b))
```

```
echo "Modular of $a and $b is $mod"
```

Output :

```
$ bash arith
```

```
Enter a: 2
```

```
Enter b: 3
```

Addition of 2 and 3 is 5

Subtraction of 2 and 3 is 1

Multiplication of 2 and 3 is 6

Division of 2 and 3 is 0

Modulus of 2 and 3 is 2

2. Write a shell program to perform relational operator.

read - p "Enter a:" a

read - p "Enter b:" b

if ((\$a == \$b)); then

echo "\$a is equal to \$b"

else

echo "\$a is not equal to \$b"

fi

if ((\$a != \$b)); then

echo "\$a is not equal to \$b"

else

echo "\$a is equal to \$b"

fi

if ((\$a < \$b)); then

echo "\$a is less than \$b"

else

echo "\$a is not less than \$b"

fi

if ((\$a <= \$b)); then

echo "\$a is less than or equal to \$b"

else

echo "\$a is not less than or equal to \$b"

fi

if ((\$a > \$b)); then

echo "\$a is greater than \$b"

else

echo "\$a is not greater than \$b"

fi

If ((\$a >= \$b)); then

echo "\$a is greater than or equal to \$b"

else

echo "\$a is not greater than or equal to \$b"

fi

Output

\$ bash relational

Enter a : 5

Enter b : 9

5 is not equal to 9

5 is not equal to 9

5 is less than 9

5 is less than or equal to 9

5 is not greater than 9

5 is not greater than or equal to 9

3) Write a shell program to perform logical operators

read - p 'Enter a : ' a

read - p 'Enter b : ' b

if ((\$a == "true" & \$b == "true")); then

echo Both are true

else

echo Both are not true

fi

if ((\$a == "true" || \$b == "true")); then

echo at least one of them is true

else

Expt. No.

Reg. No.

Date

Page No.

echo None of them is true

if
if (! \$a == "true"); then
echo "a" was initially false
else

echo "a" was initially true

fi
Output

\$ bash logic

Enter a: true

Enter b: false

Both are true

At least one of them is true

a was initially true

4. Looping statements in shell scripts

i) While Statement

a=0

while [\$a -lt 10]

do

echo \$a

a=\$((expr \$a + 1))

done

Output :-

\$ bash while

0
1
2
3
4
5
6
7
8
9

For statement

```
for a in 1 2 3 4 5 6 7 8 9 10
do
if (( $a == 5 ))
then
break
fi
echo "Iteration no $a"
done.
```

Output

Iteration no 1

Iteration no 2

Iteration no 3

Iteration no 4

Implementing for loop with continue statement
for a ~~at~~ in 1 2 3 4 5 6 7 8 9 10
do

if (\$a == 5)

then

continue

fi

echo "Iteration no \$a"

done

output

Iteration no 1

Iteration no 2

Iteration no 3

Iteration no 4

Iteration no 5

Iteration no 6

Iteration no 7

Iteration no 8

Iteration no 9

Iteration no 10

3) Until loop

a > 0

until [\$a -gt 10]

do

echo \$a

((a++))

done

output:

0
1
2
3
4
5
6
7
8
9
10
